THE WORLDWIDE BODY-MIND CONTROL SYSTEM IS BEING CONSTRUCTED

Historical Foundations of Tyranny and the Machiavellian Legacy

The history of political power is rooted in the strategic concealment of intentions. Men who serve tyrants often advise their leaders to hide their true goals, as it is significantly easier to seize and maintain power when adversaries are uncertain of the next move. A tyrant seeks to understand the inner thoughts of his enemies, employing spies to gather intelligence and learning to interpret body language and emotional cues. This surveillance allows a ruler to determine if an individual is offering genuine loyalty or merely using flattery to mask a conspiracy.

Niccolò Machiavelli stands as the preeminent master of this art. His seminal works, including The Prince and the Discourses, have served as instructional manuals for leaders willing to abandon moral considerations in favor of autocratic rule. Figures such as Marx, Lenin, Stalin, and Mao built upon these Machiavellian foundations to refine methods of mass control that effectively enslave entire nations and render opposition nearly impossible. In the modern era, the creation of a global prison system requires extreme efficiency and advanced technology for the early detection of dissident activity. The elite who operate behind the scenes are currently leveraging sophisticated tools to implement such a system on a worldwide scale.

Yuval Noah Harari and the Ideology of the Hackable Animal

One of the most prominent voices for this new global order is Yuval Noah Harari, an Israeli professor whose philosophy exerts significant influence over global leaders. Harari views the human species as a type of animal that requires management and control by qualified experts. His books, including the foundational work Sapiens: A Brief History of Humankind, have reached a massive audience, selling over 45 million copies globally. Harari’s ideas are particularly influential among those developing Artificial Intelligence (AI).

A central and controversial tenet of Harari’s worldview is that AI will eventually assume most tasks currently performed by people, leading to a massive "useless class" of redundant individuals. He suggests that the numbers of this class will need to be drastically reduced, envisioning a global eugenics program. This perspective is shared by other influential figures, such as Bill Gates, who has recommended Harari’s work and similarly categorizes humans as animals.

Harari’s prestige is bolstered by his association with the World Economic Forum (WEF), where billionaires meet annually in Davos, Switzerland, to discuss the progress of a "new world order". In his addresses at Davos and in public speeches, Harari has declared that humans are now "hackable animals". By "hackable," he refers to the ability to access and direct a person’s neurological functions wirelessly from a distant location. This technology allows external actors to influence the minds and bodies of unwitting individuals, posing a severe threat to social freedoms.

The Technological Infrastructure of Global Surveillance

The shift toward a "hackable" humanity is supported by the construction of massive data centers intended to process colossal amounts of personal data in real time. These centers are not primarily for productive commercial activity but serve as the backbone for a worldwide system of body-mind control and surveillance. Harari explicitly notes that both corporations, such as Google and Microsoft, and governments will use this technology to monitor and oppress populations.

An example of this level of surveillance is the "biometric bracelet". Harari describes a scenario where an employer can use such a device to monitor an employee's physiological responses—such as heart rate, blood pressure, and hormone levels—to determine if the employee is being untruthful. This technology allows those in power to assess the level of resistance to unpopular policies and address potential troublemakers before they can organize. Harari admits that this technology will "change everything" in both democracies and dictatorships, potentially turning former democracies into oppressive regimes through pervasive surveillance.

Analyzing U.S. Patent 10,163,055: Routing Policies for Biological Hosts

While Harari's claims may seem speculative to some, technical evidence suggests such systems are already under development. A critical piece of evidence is U.S. Patent 10,163,055, titled Routing Policies for Biological Hosts. Granted to AT&T in late 2018, the patent describes a system for achieving real-time wireless communication and control among large social groups.

The patent introduces several key concepts that bridge the gap between technology and biology:

- **Neurological Area Network: This refers to the complex of nerves within the body, including the brain, which acts as a network for transmitting electrical signals.**
- **Communications Device: Any device, such as a smartphone, that can interface with a neurological area network to receive, interpret, and send signals.**
- **Wireless Interface: The system can utilize cellular networks, Wi-Fi, Bluetooth, or even the internet to communicate with the human brain.**

The implications of this patent are profound. It suggests that a smartphone can be used to communicate wirelessly with a person's brain, sending signals to it and receiving data from it. The system can operate over any portion of the electromagnetic spectrum and even utilize local power lines to transmit signals.

Wireless Electrodes and Interhost Control

A significant breakthrough mentioned in the patent is the "wireless electrode". Unlike traditional electrodes that require surgical intervention, a wireless electrode allows for an electrical connection to the brain without any physical implants. This represents a massive leap in the external control of biological brains, moving beyond experiments like those conducted by Rodriguez Delgado in 1963, where a bull was stopped mid-charge via a radio signal sent to a physical implant.

The patent also describes "interhost" communication, which involves the exchange of signals between different individuals. The document explicitly states that "one person's brain may control another person's body and vice-versa". This level of wireless, at-a-distance control suggests that such technology has already been successfully tested. Because the patent does not specify that

this control must be voluntary, it is highly likely that it can be implemented without the knowledge or consent of the subject.

Furthermore, the system aims to assign a unique network identification—similar to a MAC address used for computers—to every biological host. This would allow for the mandatory electronic identification of all citizens. Different regions of an individual's brain or body could be assigned separate addresses, allowing the system to target specific physiological or emotional states selectively or in parallel across an entire population.

Neuralink and the Strategy of Misdirection

The public is often directed toward Neuralink, Elon Musk's research program, as the forefront of brain-computer interface technology. Neuralink focuses on the medical benefits of brain implants, such as helping paralyzed patients control robotic limbs through thought. However, the 2018 AT&T patent suggests that Neuralink may be a distraction designed to make the public believe the science is more primitive than it actually is.

The patent describes capabilities similar to Neuralink—such as using thoughts to control heart pacemakers or artificial limbs—but emphasizes that these can be achieved without surgery or physical implants. The true merit of the system described in the patent is its scalability; it can be applied to an entire population because it does not require invasive procedures.

The Role of Electronic Tattoos and Social Credit

Another component of this system is the "changeable tattoo". The patent describes a tattoo capable of changing its visual appearance in response to a person's thoughts or neurological signals. Such a tattoo could serve as a visible interface for environmental monitors, allowing local devices to surveil groups in public settings. These sensors could track an individual's mood, physiology, vaccination status, or social credit score.

Bill Gates is a major proponent of "electronic tattoos," which use "smart ink" with nanocapacitors for health tracking and communication. The patent even suggests that these tattoos could display another person's thoughts, granting outsiders real-time access to an individual's mental and emotional state. This invasive technology provides unlimited scope for unscrupulous actors to interfere with the lives of citizens.

The Delivery Mechanism: Nanotechnology and Mass Vaccination

A critical question remains: how are these "wireless electrodes" introduced into the body? The answer likely lies in nanotechnology. Nanoparticles, which are measured in millionths of a millimeter, can act as tiny antennas responsive to electromagnetic energy. Through a process called "molecular self-assembly," these disordered components can form organized structures within the body without external direction.

If these particles accumulate in the brain, they can broadcast neurological signals to a sensitive receiver. Over time, researchers can map these signals to specific chemical and behavioral activities, creating a "brain map" common to all humans. These particles could be "smuggled" into the body via the air, food, or water supply, but the most effective method is injection. By injecting particles directly into the bloodstream, they can bypass the blood-brain barrier.

This makes mass vaccination the ideal delivery system for connecting a population to the body-mind control network. The ruling elite have promoted vaccination as the solution to all pandemics, and the number of recommended injections for minors has increased dramatically since the 1960s. The author argues that COVID-19 served as a "master pandemic" to persuade billions to accept an experimental chemical concoction, with more "phony pandemics" expected in the future.

Biblical Prophecy and the End Time Scenario

For many, the implications of a system designed to "hack everyone" are difficult to grasp without the context of biblical prophecy. The Bible describes the End Time as a seven-year period of turmoil, during which a false "Jesus Christ" or Antichrist will appear and deceive many. This system of control could enable a central authority to influence the emotions of entire nations, stimulating excitement, anger, or anxiety to propel populations in a specific political direction.

The author highlights the "Mark of the Beast" mentioned in Revelation, suggesting that the technological system described in the patent will eventually be used to deliver this mark. This mark could take the form of a permanent tattoo on the hand or forehead, which individuals would accept to receive the benefits of "membership" in the world leader's system. This leader, the counterfeit Christ, will claim to have solved mankind’s problems and ushered in a golden age.

The Deception of Cosmic Consciousness

The Antichrist will not present himself as wicked but will instead promise "the Light" and a state of exalted consciousness. The technological system may even emit signals that induce powerful mystical or psychedelic experiences, leading individuals to believe they have attained "cosmic consciousness" or self-realization. This cunning deception is intended to lead humanity into voluntary worship of the Devil.

In the initial stages, the system might be used to affect physical health rather than the mind. For instance, signals could be sent to reduce heart rates, causing widespread fatigue that "experts" might blame on a new virus. A new "vaccine" would then be offered as a miraculous cure, which would actually be the mechanism for turning the masses into hyper-obedient slaves.

Conclusion and Spiritual Defiance

The construction of the worldwide body-mind control system is a project of the "antichrist brigade" targeting those who have not accepted Christ. However, many will recognize the manipulation and reject the system, even at the cost of their lives. Faith in Jesus Christ is presented as the only way to avoid the wrath of God and eternal damnation during this period of testing and judgment. The author concludes by praising the mercy of God and the redemption offered through Christ.

Analogy for Understanding Neurological Hacking

Imagine your brain is like a highly sophisticated, private computer network that has always operated in a "closed" loop, disconnected from the outside world. This new technology acts like a stealthy, high-speed Wi-Fi router that is installed in your home without your knowledge. Suddenly,

your private "computer" (your brain) is no longer private; it is broadcast on a public frequency. A "hacker" (the system controller) can now log into your files, see what you are thinking, and even "upload" new software (emotions or commands) that your body executes as if the ideas were your own. The vaccine, in this metaphor, is the physical installation of the internal "antennas" that allow your brain to connect to this external router.
